Instructions :-

- I have renamed all stop words files.(Like StopWords_1, StopWords_2...). So
 I can iterate all files.
- o I used beatiful soup library for data crawling.
- I extracted Text Article from each URL then removed punctuations, stop words and converted them into tokens.
- After converting into tokens, I have done lemmatization on each words present in tokens.
- So each word present in the token is converted to their root form.
- o Output file is also present in the Blackcoffer folder.
